

PRACTI-SEAS

DIGITIZING MARITIME COMMUNICATIONS

The project is aimed at digitizing communications in the maritime field, particularly relating to safety and surveillance, measurements at sea and navigation systems that require significant data-transfer capacity.

The PRACTI-SEAS project will therefore develop a software radio platform devoted to digital communications in the maritime domain.

Two prototypes – one specifically for maritime safety and assisted navigation and the other for instrumented buoy-to-shore data transfer – will be brought into operation and deployed for testing and validating purposes.

The PRACTI-SEAS project is also recognised by the Images&Réseaux cluster.
